

K-CARB + Hazy, Hot and Humid Challenge

Summer brings us more stress, milk fat depression (MFD), early embryonic death and lost production. Ensure the future profitability of your highest producing cows and help them to produce and reproduce. Enhance your heat abatement program with adding additional potassium (K) to the diet. Research shows that K levels at 1.5% are the best in dealing with heat stress. K-Carb+ is a fat encapsulated Potassium Carbonate. K-Carb+ delivers 53% Potassium, 10% more than the nearest competitor, while greatly reducing the handling issues of the leading Potassium supplement for less cost and a lot less shrink!

Avoid excessive shrink from heat of hydration when mixing

Hazy Hot and Humid weather is here for the Summer. Supplementing additional Potassium is the best way to help high producing cows along with proper heat abatement programs. Is your current source of K problematic? Tired of dealing with heat of hydration and shrinkage from having to discard wet and hot bags? K-Carb+ is the answer. Take our K-Carb+ one month Hazy Hot and Humid challenge.

MarSyt will give you one bag of K-Carb+. We ask you to place it alongside a bag of the leading competitive product in the dampest part of your Mill/Warehouse. We will come back in a month and evaluate.

Do not let shrink erode your profitability.
